Chip Dimensions and Pad Layout

Dimensions in parenthesis are in millimeters and are derived from the basic inch dimensions as indicated. Pad dimensions are in mils (10^{-3} inch).

Special Considerations

In applications that employ separate power sources to drive VDD and the signal inputs, the VDD current capability should exceed VDD/RL (RL = effective external load of the four CD4066B bilateral switches). This provision avoids any permanent current flow or clamp action on the VDD supply when power is applied or removed from the CD4066B.

In certain applications, the external load-resistor current may include both VDD and signal line components. To avoid drawing VDD current when switch current flows into terminals 1, 4, 8 or 11 the voltage drop across the bidirectional switch must not exceed 0.8 volts (calculated from RON values shown).

No VDD current will flow through RL if the switch current flows into terminals 2, 3, 9, or 10.
